The Lower and Middle Oracle sections shown on Coronado National Forest (CNF) lands, outline the area where a mastication project is scheduled to begin March 15th. Upper Oracle, HiJinks 2, and Oracle 5 are future CNF projects. Eventually all five of these areas should receive some type of fuels treatment, helping to create a much wider fuel break to protect Oracle from wildfire. The pink areas are primarily private properties that are located within Oracle's Wildland Urban Interface (WUI) areas. The 1/4 mile area shown with the dots and the 1/2 mile area, are both listed in the Oracle Community Wildfire Protection Plan (CWPP). These areas are being proposed to the Arizona Department of Forestry for grant funding, in an effort to reduce the threat of catastrophic wildfire in these neighborhoods. The upper right hand corner shown in green on the CNF map (left), and the dark pink area traveling horizontally through sections 1 and 2, show a fuel break project that was completed in 2009.
